

Raina Stofft

Project Title and Overview: The title of the project is Pattern Cabinet. Initially, the webpage would allow you to upload your own patterns you purchased and store them on the webpage. While working on the project, I altered the overview somewhat to a webpage that hosts patterns that I have completed, with a link to buy the pattern and a rating of how easy the pattern is to follow and complete.

Target Audience: The target audience is people who like to crochet, knit, or sew and are looking to avoid patterns made by AI or that have not been tested. All the patterns on the webpage have been confirmed to work or, if not, have been rated appropriately.

Core Features: Core features are the filter bar on the left side of the webpage using a script to filter between the pattern medium and type. As well as the main window that holds all the patterns made in the HTML file.

Design and UX Considerations: I wanted to have three distinct areas of the webpage in different colors, being the header, left window, and main window. Then having the filter tabs be clickable and visually showing if the filter was on or off. And keeping the same color scheme throughout with a purple background and red lettering.

Challenges and Solutions: The biggest challenge was implementing the filter script. Taking breaks and talking through the structure of the code out loud and referencing past materials and lectures did eventually help me get a working script to filter the webpage.

Lessons Learned: The most I learned is honestly what didn't make it into the project. With the initial design being based around uploading your own patterns to the website, there was a lot of research into how to host uploaded documents and how to implement a server to hold them so they don't disappear after a page refresh. A lot of half-written scripts and ideas that got scrapped, as it felt they went beyond the bounds of front-end development, but were very informative on how to implement those ideas regardless.
